DFD Level 0

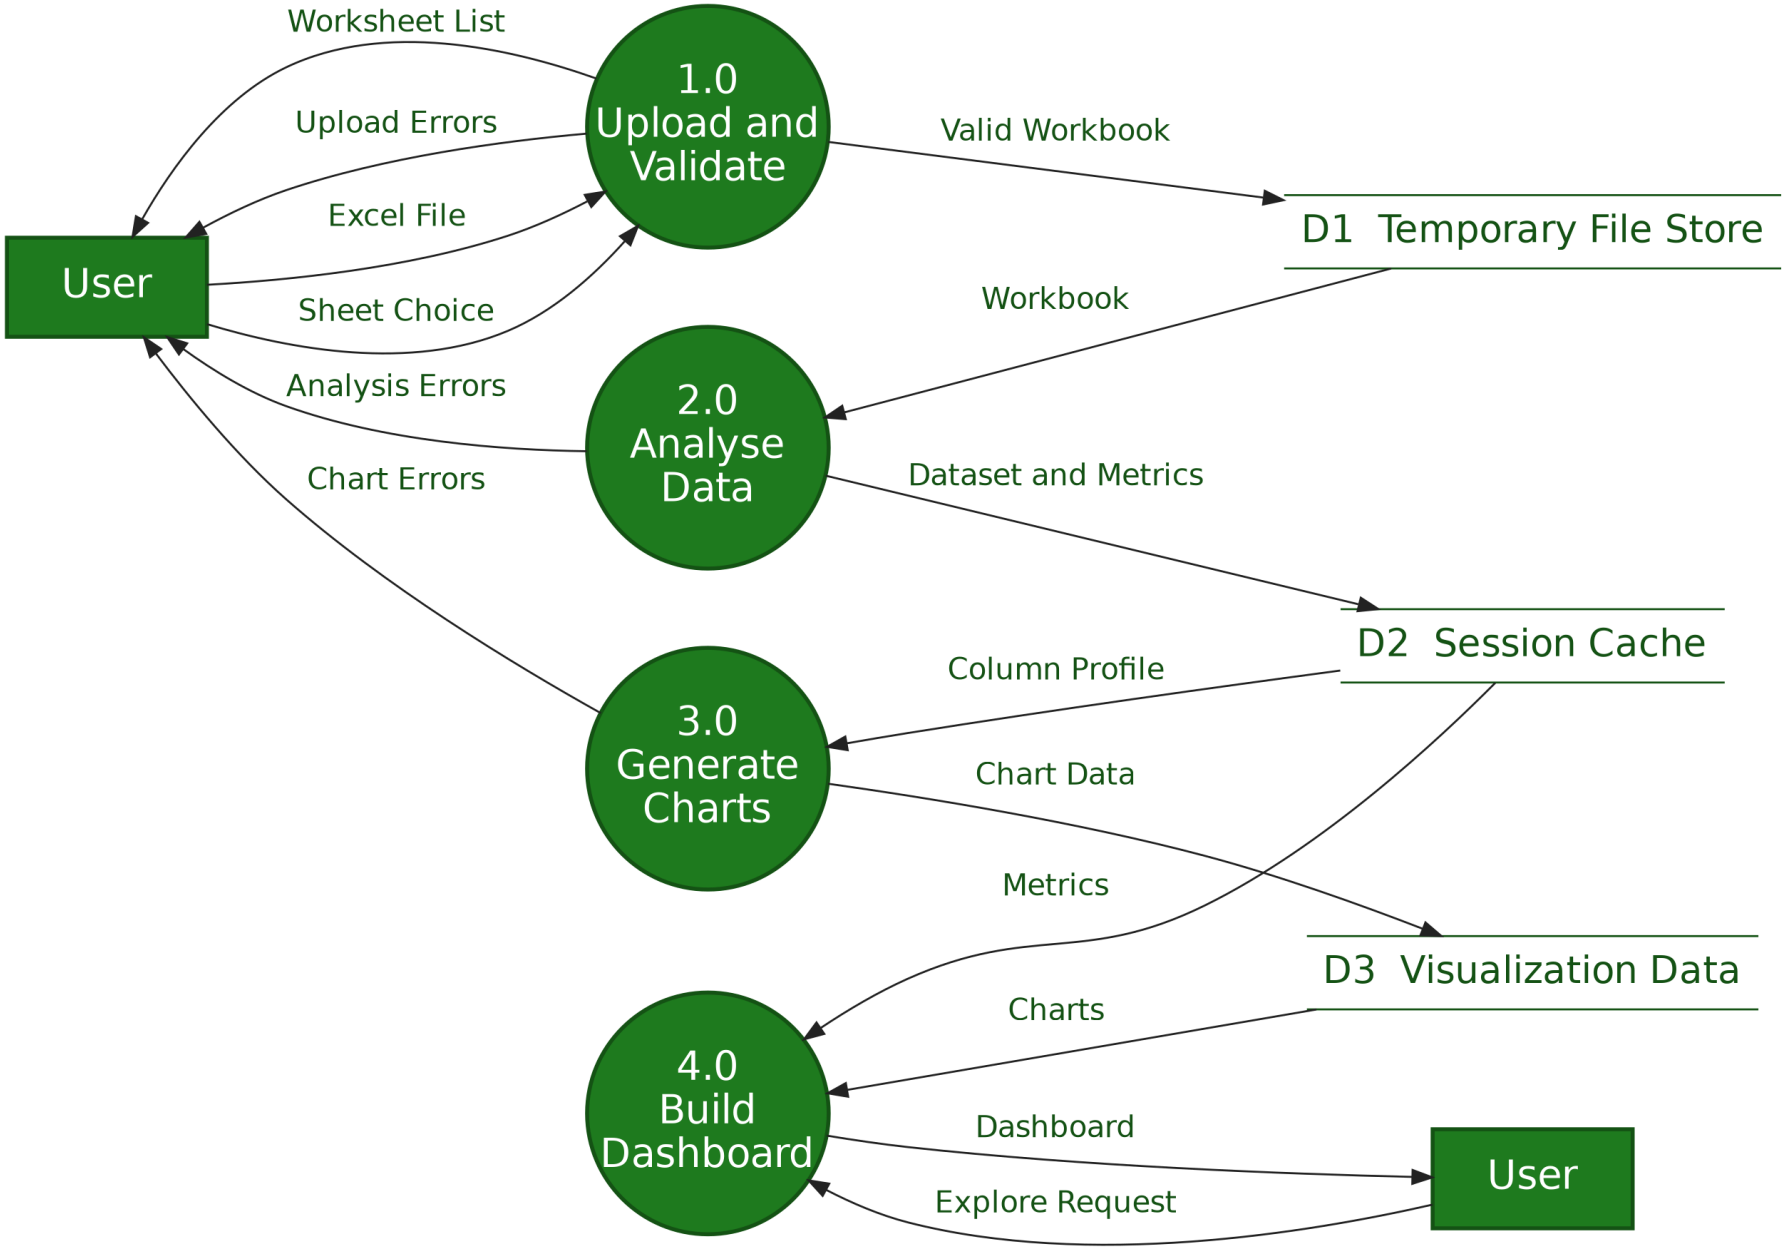

The entire system as a single process with its external entities

The AI service is optional and external. Core chart selection uses deterministic rules only, so the system works fully without it.

DFD Level 1

The system decomposed into four major processes, with data stores

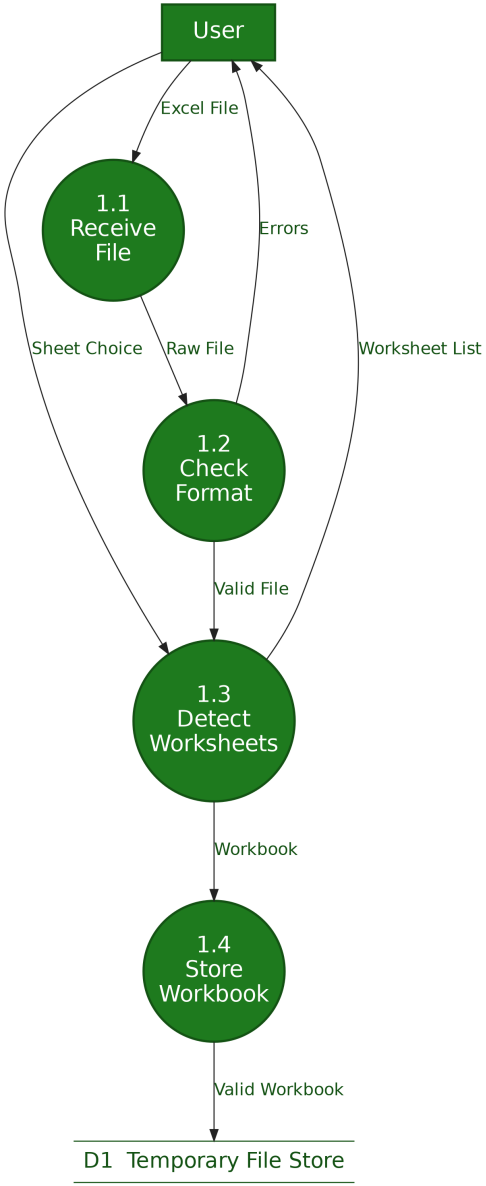

D1 holds the uploaded workbook during processing; D2 holds the analysed dataset for the active session. Both are cleared when the session ends.

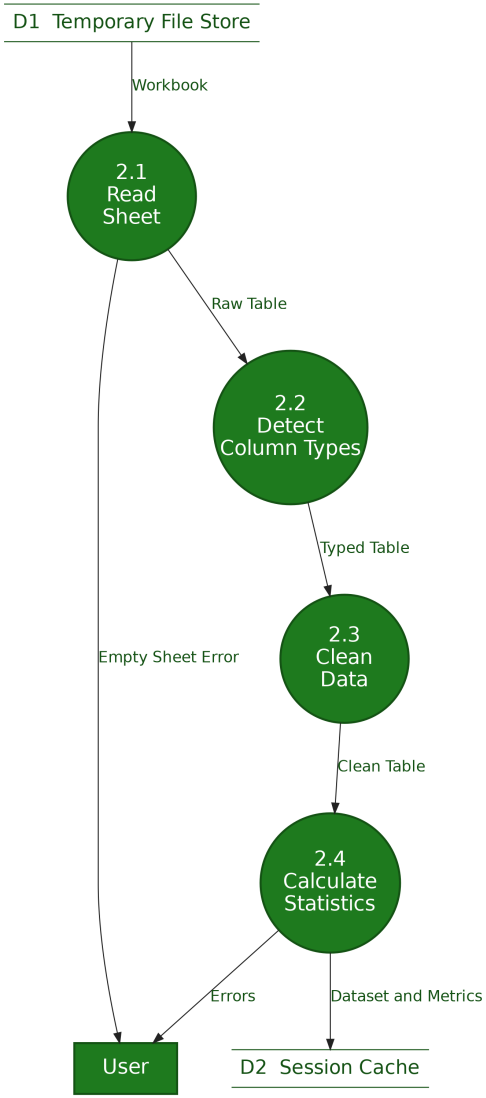

DFD Level 2

Each major process decomposed into its sub-processes

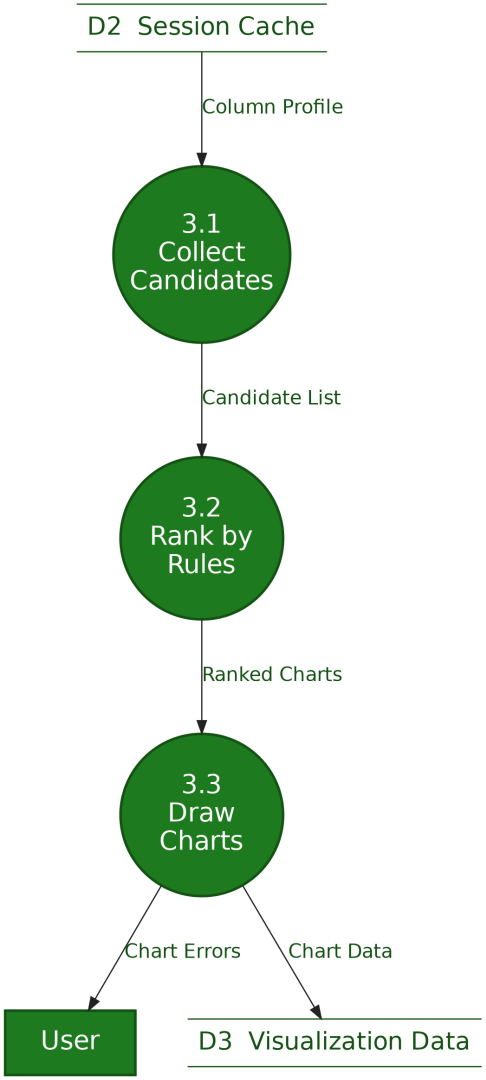

1.0 Upload and Validate

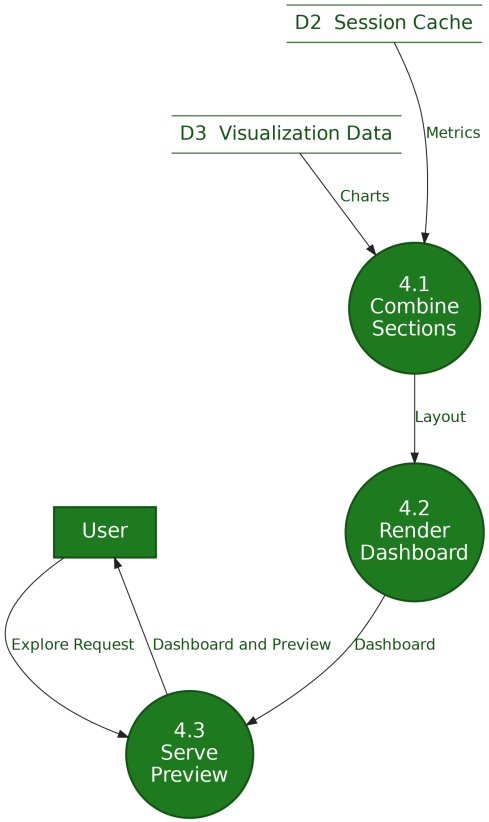

2.0 Analyse Data

3.0 Generate Charts

4.0 Build Dashboard

Column types are detected before cleaning because both cleaning and statistics depend on them. Chart candidates are ranked by fixed rules, so every chart shown can be explained.
